Making edits and merging:

- Ensure you are on the main branch: git status (should say origin/main)
- Ensure you have the latest changes from main: git pull
- Create a new branch: git checkout –b <first initial last name>/<description of branch>
- Edit your file
- When you want to commit your edits:
    - git add <file name>
    - git commit –m "<commit message>"
    - git push
        - Here, you will see an error message about creating an upstream branch
        - Copy and paste that push command into your terminal
- First time pushing? Create a pull request using the link in the terminal:
    - 

- Create the pull request by following the link above
- Before merging, please rebase your code and resolve any merge conflicts
    - git fetch origin main
    - git rebase origin/main
    - During conflict resolution: git rebase –continue
    - After conflict resolution: git push –f (force push)
- Please also squash all your commits
    - git rebase –i HEAD~<number of commits>
        - Put an "s" for all the commits excluding the top one
        - One the next window, you can change the commit message
    - git push -f
- MAKE SURE you get at least 2 approver on your code before merging
    - I know it's tempting to hit that big green button but don't, please
- Merge
- Return to main: git checkout main and git pull

If you are unsure of anything, please ping Phil on teams or text message
